

SceneControl® 5100

Design, Manufacture and Installation of Theatrical Equipment Worldwide

SceneControl® 5100 Multiple Preset Control for Individual Hoists

When you need accurate, repeatable positioning for battens that raise and lower equipment or curtains, you need the SceneControl® 5100 controller. Set up to eight presets – soft upper, soft lower, and six intermediate targets – and run your motorized hoist with the knowledge that it will always return to the right place.

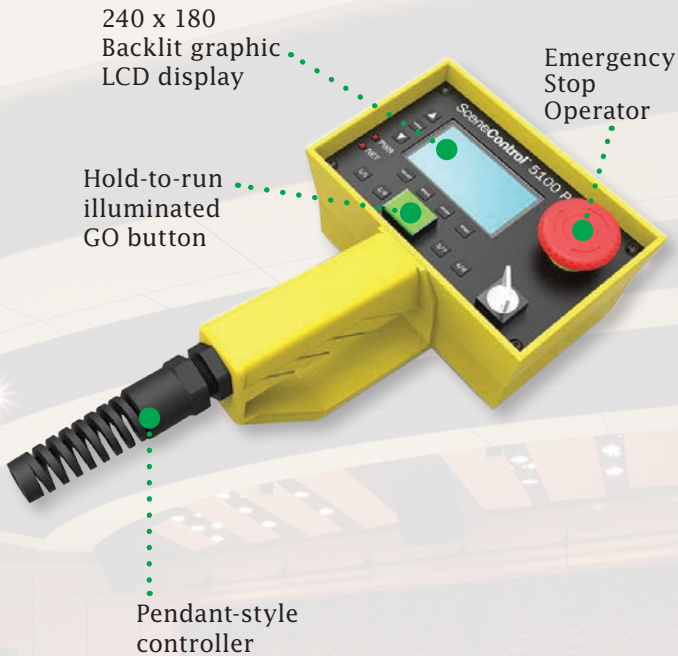

The SceneControl® 5100 controller is the perfect pendant device for your electrics, battens, house curtain, teasers, masking, acoustic shell ceilings and other soft goods that need to return to the same position every time. Use this single-axis preset controller for fixed or variable speed scenery battens, a house curtain, a backdrop or cyclorama that always trims at the same level.

Touch-screen Capability for Quick Programming

With a 240 x 180 backlit graphic LCD display, the SceneControl® 5100 controller lets you set a batten's limits and presets quickly and easily. Follow the onscreen prompts to set the target and speed of a variable speed hoist. Use the GO button to raise or lower the batten to its target position.

- Choose a controller with 1, 4 or 8 axes.
- Portable pendant allows the operator to watch the batten move from any point backstage (with proper receptacle locations).
- See the batten's position, target, and status on the color display.
- When not in use, the pendant can be hung on the wall or stored in an optional storage case.

SceneControl® 5100 Console

Scalable Control for Your Stage

One day your production capabilities may expand – and the SceneControl® family of controllers is ready when you are. The SceneControl® 5100 controller's infrastructure is the same as the larger and more complex SceneControl® controllers. Add hoists and upgrade your controller seamlessly within the SceneControl® family.

Important Safety Features

- Emergency Stop Operator
- Password protection to allow access only to authorized users
- Load sensing capability
- Automatic alarms if an error or fault is detected
- Illuminated GO button
- Hold-to-run function requires the operator to be at the controller when scenery is moving
